

Computational Focus Stacking Derived from Spatially-Varying Autofocus

- Carnegie Mellon developed a system that allows different regions of the same image to focus at different depths simultaneously
- Our project is on implementing this concept through focus stacking
 - a. Take ~10 photographs of the scene
 - b. Changing the focus of each photo
 - c. Utilize algorithm to align and detect sharpest regions of each image
 - d. Combine all regions to create the "sharpest" focused photograph
